## Create a profile picture

Suppose you are in a museum with other participants.

The visit will start in a few minutes, and your teacher will create a new group.

You must be ready to join the group by setting up your profile picture.

### Version 1

- **Tests and Problems**

- The incomprehensible interface button and the profile and settings screen confused users about the right one to set up the image.

- **Resolution**

- Merge the two screens into the profile screen only and change its icon into a self-explanatory one.

### Version 2

- **Tests and Problems**

- The profile icon was too small.

- **Positive Aspects**

- The profile icon understood when seen.

- **Resolution**

- Resize the profile icon
- Lighten screens by changing the colour and making them more minimalist.

# Create a group

Suppose you want to create a group.

You want to hide the profile picture of the group's members.

## Version 1

- **Tests and Problems**

- Difficulty in clicking the button for creating the group.
- Lack of a setting to show/hide participants' photos.
- Users are confused by the non-clickable GPS button.

- **Resolution**

- Replace the big Material Design card with a button.
- Introduce an option to toggle the visibility of participant photos in the group creation process.
- Simplify the user experience by excluding the step that involves selecting between Bluetooth and GPS technology.

## Version 2

- **Tests and Problems**

- Oversized group creation button.
- Complex screen layout and too bright colours.

- **Resolution**

- Reduce the size of the group creation button to enhance usability.
- Improve user understanding and ease of navigation by simplifying the layout of the screen.

## Join a group

Suppose your teacher created a group.

She provided the information to join the group.

You want to join the group in the shortest possible time.

### Version 1

- **Tests and Problems**
  - Group identifier too long.
  - Users are confused by the non-clickable GPS button.
- **Resolution**
  - Implemented a new algorithm for generating the group identifier.
  - Removed the step that involves clicking on the GPS button.

### Version 2

- **Tests and Problems**
  - The group identifier still needs to be entered by the user manually.
  - Low contrast between the background color and other components on the screen.
- **Positive Aspects**
  - Reduced length of the group identifier.
  - Shortened the duration for entering the group identifier manually.
- **Resolution**
  - Replaced the screen background colour.
  - Group identifiers can now be manually entered or scanned using a QR Code.
